## Deep Learning

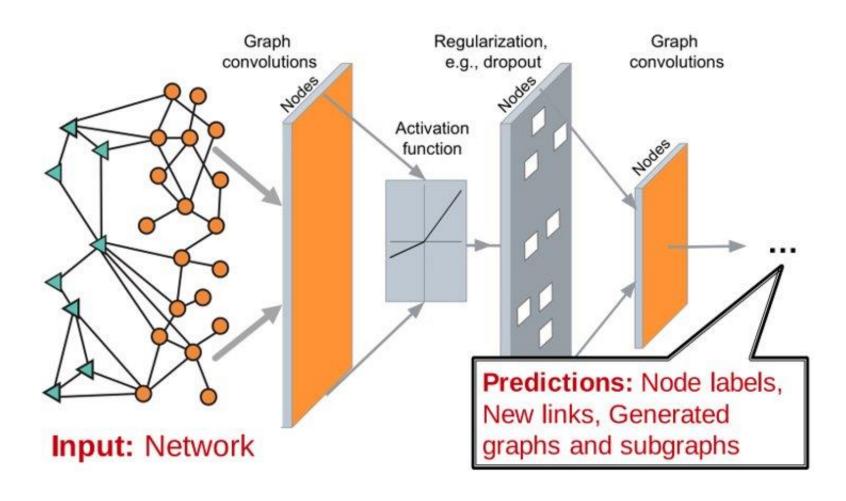

## Why Graph Neural Network?

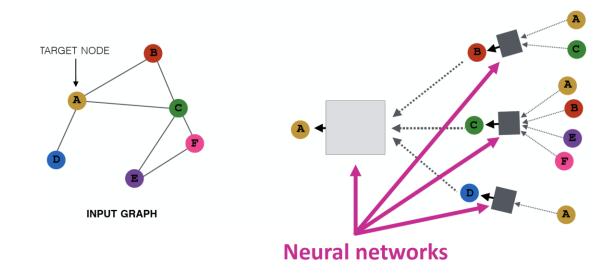

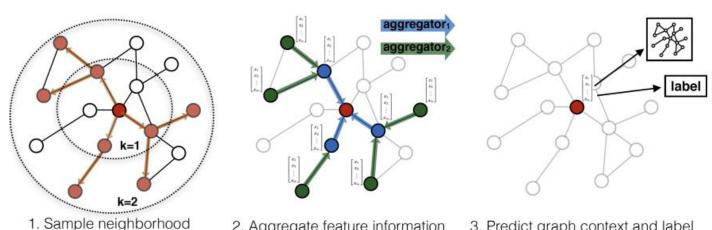

- Arbitrary size and complex topological structure (i.e., no spatial locality like grids)
- No fixed node ordering or reference point

## Graph Neural Network (GNN)

## **GraphSAGE**: Inductive representation learning

```
Algorithm 1: GraphSAGE embedding generation (i.e., forward propagation) algorithm
   Input: Graph \mathcal{G}(\mathcal{V}, \mathcal{E}); input features \{\mathbf{x}_v, \forall v \in \mathcal{V}\}; depth K; weight matrices

## Challenge in molecular graph representation

#### Challenges

Different molecular properties depends on their local chemical environments

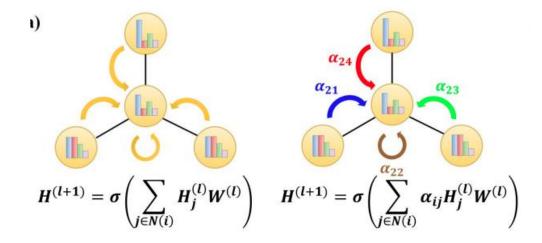

#### Solution

- Add adaptive attention weights depends on their chemical environments
- Adjust the update rate of node states at each convolution layers

### Attention mechanism

$$\alpha_{ij} = \frac{e_{ij}}{\sum_{k \in N(i)} e_{ik}} = \frac{\sigma(MLP[H_iW, H_jW])}{\sum_{k \in N(i)} \sigma(MLP[H_iW, H_kW])},$$

the importance rate of each adjacent node

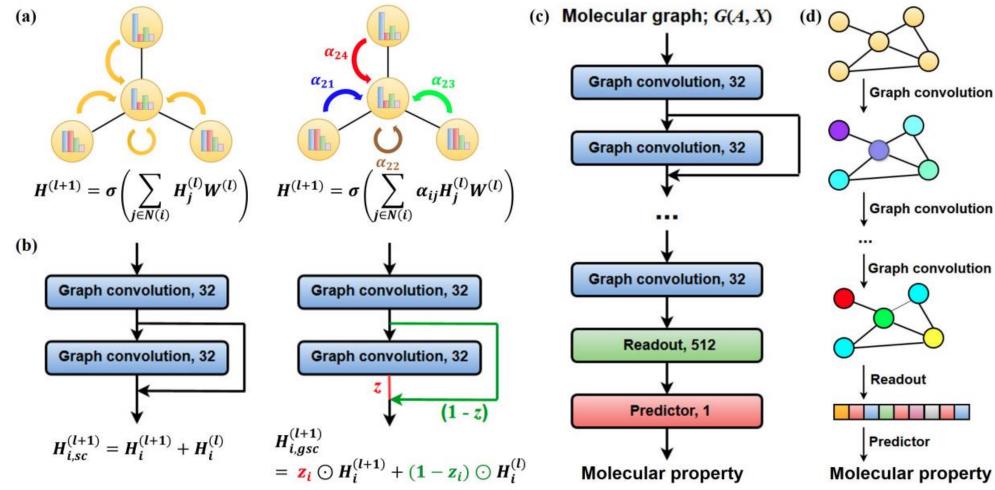

$$\alpha_{ij}^{(l)} = \sigma((H_i^{(l)}W^{(l)})C^{(l)}(H_j^{(l)}W^{(l)})^T),$$

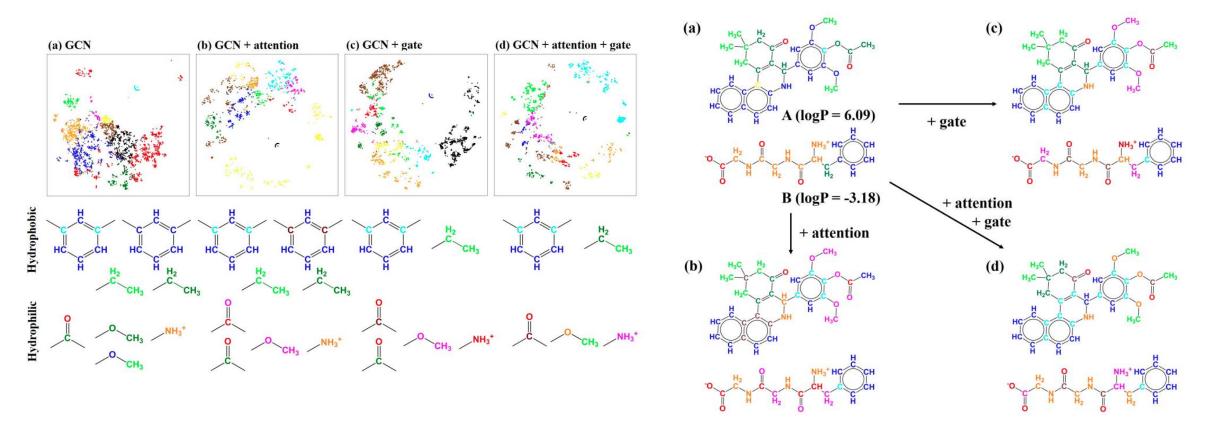

the attention coefficient should be analogous to **the interaction strength** between an atom pair (i, j)

\* C (I) is a coupling matrix. Note that the coupling matrix may correspond to the dictionaries containing pairwise interactions in Shang's model.

## Challenge in molecular graph representation

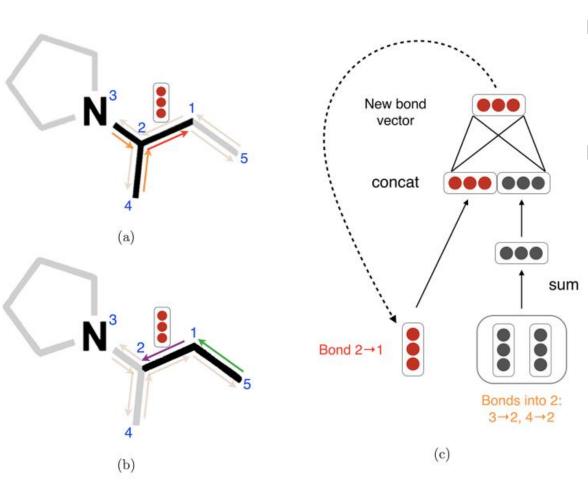

#### Challenges

• a poor molecular representation by memorizing the molecular scaffolds in training data **fails to generalize** to new ones.

#### Solution

- A hybrid representation that combines convolutions and descriptors
- Convolutions centered on bonds (edge), instead of atoms (node)

## Edge-based molecular representation learning for chemical property prediction

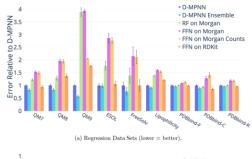

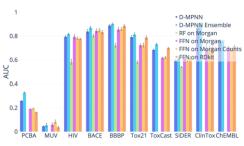

Edge-based aggregation

$$m_{vw}^{t+1} = \sum_{k \in \{N(v) \setminus w\}} M_t(x_v, x_k, h_{kv}^t)$$

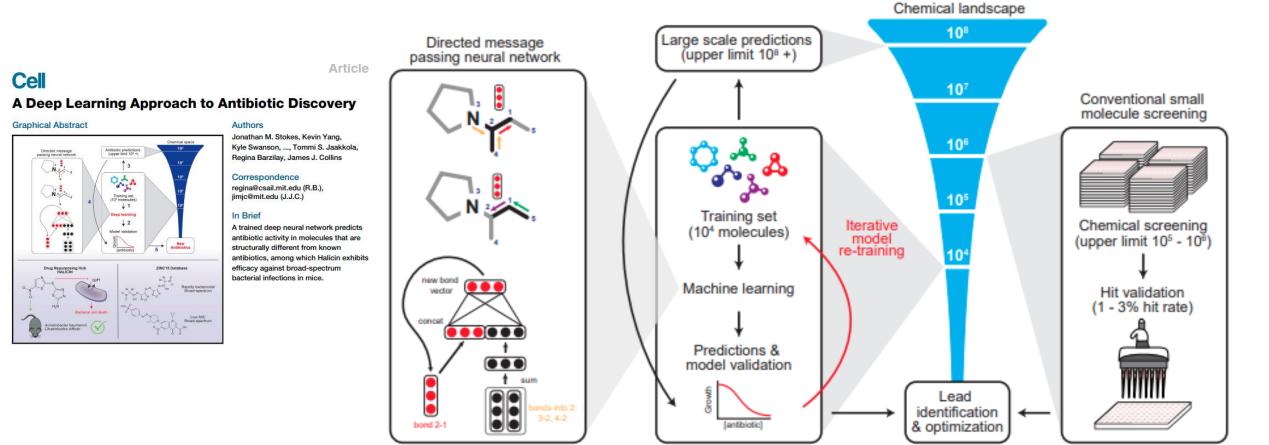

Edge-based update

$$h_{vw}^{t+1} = U_t(h_{vw}^t, m_{vw}^{t+1})$$

## **GNN** increase the predicton accuracy in AlphaFold

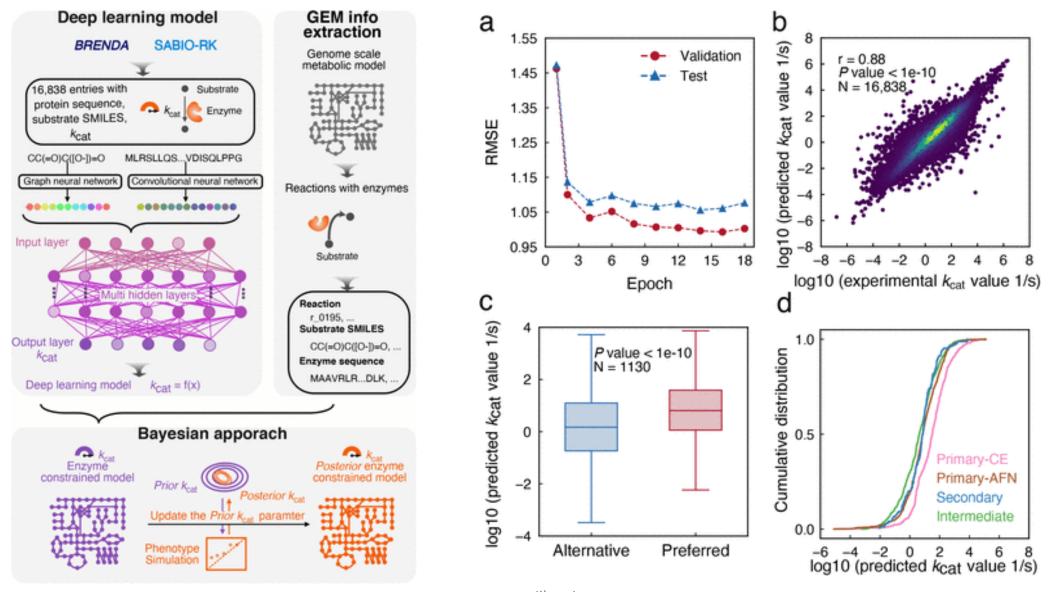

## Structure-based **protein function** prediction

### Structure-based Kcat prediction

### Conclusion

- Graph Neural Network (GNN) has **arbitrary size** and **complex topological structure** (i.e., no spatial locality like grids).
- GNN can represent **the molecular properties** from its structure without feature engineering.
- A model of GNN is adaptive and task-dependent.
  - Understanding mathematical framework (learning process) of GNN is crucial to design model architecture.
